

JC Schools Yearly AP Microeconomics Standards

Units	Priority Standards (Learning Objectives)	Essential Knowledge Standards
Unit 1 Basic Economic Concepts	<p>1.1: DEFINE <u>resources and the cause(s) of their scarcity</u></p> <p>1.2: DEFINE <u>how resource allocation is influenced by the economic system adopted by society.</u></p> <p>1.3 a. DEFINE <u>(using graphs as appropriate) the production possibilities curve (PPC) and related terms.</u></p> <p>1.3 b. EXPLAIN <u>(using graphs as appropriate) how the production possibilities curve (PPC) illustrates opportunity costs, trade-offs, inefficiency, efficiency, and economic growth or contraction under various conditions.</u></p> <p>1.3 c. CALCULATE <u>(using data from PPCs or tables as appropriate) opportunity cost.</u></p> <p>1.4 pt 1 a. DEFINE <u>absolute advantage and comparative advantage.</u></p> <p>1.4 pt 1 b. DETERMINE <u>(using data from PPCs or tables as appropriate) absolute and comparative advantage.</u></p> <p>1.4 pt. 2 a. EXPLAIN</p>	<p>1.1: MKT-1.A.1 Economic trade-offs arise from the lack of sufficient resources (scarcity) to meet society's wants and needs.</p> <p>1.1: MKT-1.A.2 Most factors of production (such as land, labor, and capital) are scarce, but some factors of production (such as established knowledge) may not be scarce due to their non-rival nature.</p> <p>1.2: MKT-1.B.1 Resource allocation involves answering three basic questions: What goods and services to produce? How to produce those goods and services? And who consumes those goods and services?</p> <p>1.2: MKT-1.B.2 Resource allocation is significantly influenced by the economic system adopted by society, such as command economy, market economy, or mixed economy. Each system involves a particular set of institutional arrangements and a coordinating mechanism for allocating scarce resources and distributing output.</p> <p>1.3: MKT-1.C.1 The PPC is a model used to show the trade-offs associated with allocating resources.</p> <p>1.3: MKT-1.C.2 The PPC can be used to illustrate the concepts of scarcity, opportunity cost, efficiency, underutilized resources, and</p>

(using data from PPCs or tables as appropriate)
how specialization according to comparative
advantage with appropriate terms of trade can lead
to gains from trade.

1.4 pt. 2 b. CALCULATE

(using data from PPCs or tables as appropriate)
mutually beneficial terms of trade

1.5 pt. 1 a.

DEFINE opportunity cost

1.5 pt. 1 b.

EXPLAIN the opportunity costs associated with
choices.

1.5 pt. 2 b.

EXPLAIN a decision by comparing total benefits and
total costs (using a table or a graph when
appropriate).

1.5 pt 2 b.

CALCULATE total benefits and total costs (using a
table or graph where appropriate).

1.6 pt 1 a.

DEFINE the key assumptions of consumer choice
theory

1.6 pt 1 b. E

EXPLAIN (using a table or graph as appropriate)
how a rational consumer's decision-making involves
the use of marginal benefits and marginal costs.

1.6 pt 1 c.

CALCULATE (using a table or a graph when
appropriate) how a rational consumer's decision
making involves the use of marginal benefits and
marginal costs.

economic growth or contraction.

1.3: MKT-1.C.3

The shape of the PPC depends on whether opportunity costs are constant, increasing, or decreasing.

1.3: MKT-1.C.4

The PPC can shift due to changes in factors of production as well as changes in productivity/technology.

1.3: MKT-1.C.5

Economic growth results in an outward shift of the PPC.

1.4 pt. 1: MKT-2.A.1

Absolute advantage describes a situation in which an individual, business, or country can produce more of a good or service than any other producer with the same quantity of resources.

1.4 pt. 1: MKT-2.A.2

Comparative advantage describes a situation in which an individual, business, or country can produce a good or service at a lower opportunity cost than another producer.

1.4 pt. 2: MKT-2.B.1

Production specialization, according to comparative advantage, not absolute advantage, results in exchange opportunities that lead to consumption possibilities beyond the PPC.

1.4 pt. 2: MKT-2.B.2

Comparative advantage and opportunity costs determine the terms of trade for exchange under which mutually beneficial trade can occur.

1.5 pt. 1: CBA-1.A.1

Rational agents consider opportunity costs, whether implicit or explicit when calculating the total economic costs of any decision.

1.5 pt. 1: CBA-1.A.2

Total benefits form the metric "utility" for consumers and total revenue for firms.

1.5 pt. 2: CBA-1.B.1

Total net benefits, the difference between total benefits and total costs, are maximized at the optimal choice.

1.6 pt. 2 a.

DEFINE marginal analysis and related terms

1.6 pt. 2 b.

EXPLAIN a decision using marginal analysis (using a table or a graph when appropriate)

1.5 pt. 2:CBA-1.B.2

Some decisions permit rational agents to look at only marginal benefit and marginal cost. Other decisions cannot be broken down into increments in this way and must be evaluated by looking at total benefits and total costs.

1.6 pt. 1: CBA-2.A.1

Consumers face constraints and have to make optimal decisions accounting for these constraints.

1.6 pt. 1: CBA-2.A.2

In a model of rational consumer choice, consumers are assumed to make choices so as to maximize their total utility.

1.6 pt. 1: CBA-2.A.3

Consumers experience diminishing marginal utility in the consumption of goods and services.

1.6 pt. 1: CBA-2.A.4

Consumers allocate their limited income to purchase the combination of goods that maximizes their utility by equating/comparing the marginal utility of the last dollar spent on each good.

1.6 pt. 2:CBA-2.B.1

Marginal analysis involves comparing the additional benefit of increasing a given activity with the additional cost. Comparing marginal benefit (MB) with marginal cost (MC) helps individuals (firms) decide whether to increase, decrease, or maintain their consumption (production) levels.

1.6 pt. 2: CBA-2.B.2

The optimal quantity at any time does not depend on fixed costs (sunk costs) or fixed benefits that have already been determined by past choices.

1.6 pt. 2: CBA-2.B.3

The optimal quantity is achieved when marginal benefit is equal to marginal cost or where total benefit is maximized.

<p>Unit 2</p> <p>Supply and Demand</p>	<p>2.1 a. DEFINE <u>(using graphs as appropriate) key terms and factors related to consumer decision-making and the law of demand.</u></p> <p>2.1 b. EXPLAIN <u>(using graphs as appropriate) the relationship between price and quantity demanded and how buyers respond to incentives and constraints.</u></p> <p>2.1 c. EXPLAIN <u>(using graphs as appropriate) buyers' responses to changes in incentives and constraints.</u></p> <p>2.2 a. DEFINE <u>(using graphs as appropriate) the law of supply.</u></p> <p>2.2 b. EXPLAIN <u>(using graphs as appropriate) the relationship between price and quantity supplied.</u></p> <p>2.2 c. EXPLAIN <u>(using graphs as appropriate) producers' (sellers') responses to changes in incentives and technology.</u></p> <p>2.3 pt. 1 a. DEFINE <u>measures of elasticity</u></p> <p>2.3 pt. 1 b. EXPLAIN <u>(using graphs where appropriate) measures of elasticity and the impact of given price change on total revenue or total expenditure</u></p> <p>2.3 pt 1 c. CALCULATE <u>(using data from a graph or table as appropriate) measure of elasticity</u></p> <p>2.4 pt. 1 a. DEFINE</p>	<p>2.1: MKT-3.A.1 A well-defined system of property rights is necessary for the market system to function well.</p> <p>2.1: MKT-3.A.2 Economic agents respond to incentives.</p> <p>2.1: MKT-3.A.3 Individuals often respond to incentives, such as those presented by prices, but also face constraints, such as income, time, and legal and regulatory frameworks.</p> <p>2.1: MKT-3.A.4 The law of demand suggests that a change in the own-price causes a change in quantity demanded in the opposite direction and a movement along a demand (marginal benefit) curve.</p> <p>2.1: MKT-3.A.5 The conceptual relationship between price and quantity stated by the law of demand leads to downward-sloping demand curves explained by the income effect and substitution effect and/or by diminishing marginal utility.</p> <p>2.1: MKT-3.A.6 The market demand curve (schedule) is derived from the summation of individual demand curves (schedules).</p> <p>2.1: MKT-3.B.1 Changes in the determinants of consumer demand can cause the demand curve to shift</p> <p>2.2: MKT-3.C.1 A change in own price causes a change in quantity supplied in the same direction and a movement along a supply curve.</p> <p>2.2: MKT-3.C.2 The market supply curve (schedule) is derived from the summation of individual supply curves (schedules). The market supply curve is upward-sloping.</p> <p>2.2: MKT-3.D.1 Changes in the determinants of supply can cause the supply curve to shift.</p>

measures of elasticity

2.4 pt. 1 b. EXPLAIN

(using graphs where appropriate) measures of elasticity and the impact of given price change on total revenue or total expenditure

2.4 pt. 1 c. CALCULATE

(using data from a graph or table as appropriate) measure of elasticity

2.5 pt. 1 a. DEFINE

measures of elasticity

2.5 pt. 1 b. EXPLAIN

(using graphs where appropriate) measures of elasticity and the impact of given price change on total revenue or total expenditure

2.5 pt. 1 c. CALCULATE

(using data from a graph or table as appropriate) measure of elasticity

2.6 a. DEFINE

(using graphs as appropriate) market equilibrium, consumer surplus, and producer surplus.

2.6 b. EXPLAIN

(using graphs as appropriate) how equilibrium price, quantity, consumer surplus, and producer surplus for a good or service are determined

2.6 c. CALCULATE

(using data from a graph or table as appropriate) areas of consumer surplus and producer surplus at equilibrium.

2.7 a. DEFINE

a surplus and shortage.

2.3: MKT-3.E.1

Economists use the concept of elasticity to measure the magnitude of percentage changes in quantity owing to any given changes in the own price, income, and prices of related goods.

2.3: MKT-3.E.2

Price elasticity of demand is measured by the percentage change in quantity demanded divided by the percentage change in price or the responsiveness of the quantity demanded to changes in price. Elasticity varies along a linear demand curve, meaning slope is not elasticity

2.3: MKT-3.E.3

Ranges of values of elasticity of demand are described as elastic or inelastic with the separating benchmark being a magnitude of 1, where the change in the price and the change in the quantity demanded are proportional.

a. When the magnitude of the value of elasticity is greater than 1, the demand is described as being elastic with respect to that price in the range of the given change.

b. When the magnitude of the value of elasticity is less than 1, the demand is described as being inelastic with respect to that price in the range of the given change.

c. When the magnitude of the value of elasticity is equal to 1, the demand is described as being unit elastic with respect to that price in the range of the given change

2.3: MKT-3.E.4

The price elasticity of demand depends on certain factors such as the availability of substitutes.

2.3: MKT-3.E.5

The impact of a given price change on total revenue or total expenditure will depend on whether demand is elastic, inelastic, or unit elastic.

2.4: MKT-3.E.6

Price elasticity of supply is measured by the percentage change in quantity supplied divided by the percentage change in price, or the responsiveness of the quantity supplied to changes in price.

2.7 b. EXPLAIN

(using graphs where appropriate) how changes in underlying conditions and shocks to a competitive market can alter price, quantity, consumer surplus, and producer surplus.

2.7 c. CALCULATE

(using data from a graph or table as appropriate) changes in price, quantity, consumer surplus, and producer surplus in response to changes in market conditions or market disequilibrium.

2.8 a. DEFINE

forms of government price and quantity intervention.

2.8 b. EXPLAIN

(using graphs where appropriate) how government policies alter consumer and producer behaviors that influence incentives and therefore affect outcomes.

2.8 c. CALCULATE

(using data from a graph or table where appropriate) changes in market outcomes resulting from government policies.

2.9 a. DEFINE

tariffs and quotas.

2.9 b. EXPLAIN

(using graphs where appropriate) how markets are affected by public policy related to international trade.

2.9 c. CALCULATE

(using data from a graph or table as appropriate) changes in market outcomes resulting from public policy related to international trade.

2.4: MKT-3.E.7

Ranges of values of elasticity of supply are described as elastic or inelastic with the separating benchmark being a magnitude of 1, where the change in the price and the change in the quantity supplied are proportional.

a. When the magnitude of the value of elasticity is greater than 1, the supply is described as being elastic with respect to that price in the range of the given change.

b. When the magnitude of the value of elasticity is less than 1, the supply is described as being inelastic with respect to

that price in the range of the given change.

c. When the magnitude of the value of elasticity is equal to 1, the supply is described as being unit elastic with respect to that price in the range of the given change.

2.4: MKT-3.E.8

The price elasticity of supply depends on certain factors such as the price of alternative inputs.

2.5: MKT-3.E.9

Elasticity can be measured for any determinant of demand or supply, not just the price.

2.5: MKT-3.E.10

Income elasticity of demand is measured by the percentage change in the quantity demanded divided by the percentage change in consumers' income. Economists use the income elasticity of demand to determine whether a good is normal or inferior.

2.5: MKT-3.E.11

Cross-price elasticity of demand is measured by the percentage change in the quantity demanded of one good divided by the percentage change in the price of another good. Economists use the cross-price elasticity of demand to determine whether goods are substitutes, complements, or not related.

2.6: MKT-4.A.1

The supply-demand model is a tool for understanding what factors influence prices and quantities and why prices and

		<p>quantities might differ across markets or change over time.</p> <p>2.6: MKT-4.A.2 In a perfectly competitive market, equilibrium is achieved (and markets clear with no shortages or surpluses) when the price of a good or service brings the quantity supplied and quantity demanded into balance, in the sense that buyers wish to purchase the same quantity that sellers wish to provide.</p> <p>2.6: MKT-4.A.3 Equilibrium price provides information to economic decision-makers to guide resource allocation.</p> <p>2.6: MKT-4.A.4 Economists use consumer surplus and producer surplus to measure the benefits markets create to buyers and sellers and understand market efficiency.</p> <p>2.6: MKT-4.A.5 Market equilibrium maximizes total economic surplus in the absence of market failures, meaning that perfectly competitive markets are efficient.</p> <p>2.7: MKT-4.B.1 Whenever markets experience imbalances—creating disequilibrium prices and quantities, surpluses, and shortages—market forces drive price and quantity toward equilibrium.</p> <p>2.7 MKT-4.B.2 Factors that shift the market demand and market supply curves cause price, quantity, consumer surplus, producer surplus, and total economic surplus (within that market) to change. The impact of the change depends on the price elasticities of demand and supply</p> <p>2.8 POL-1.A.1 Some government policies, such as price floors, price ceilings, and other forms of price and quantity regulation, affect incentives and outcomes in all market structures.</p> <p>2.8 POL-1.A.2 Governments use taxes and subsidies to change incentives in ways that influence consumer and producer</p>
--	--	---

		<p>behavior, shifting the supply and demand curves accordingly.</p> <p>2.8 POL-1.A.3 Taxes and subsidies affect government revenues or costs.</p> <p>2.8 POL-1.A.4 Government intervention in a market producing the efficient quantity through taxes, subsidies, price controls, or quantity controls can only decrease allocative efficiency.</p> <p>2.8 POL-1.A.5 Deadweight loss represents the losses to buyers and sellers as a result of government intervention in an efficient market.</p> <p>2.8 POL-1.A.6 The incidence of taxes and subsidies imposed on goods traded in perfectly competitive markets depends on the elasticity of supply and demand.</p> <p>2.9 POL-1.B.1 Equilibria in competitive markets may be altered by the decision to open an economy to trade with other countries; equilibrium price can be higher or lower than under autarky, and the gap between domestic supply and demand is filled by trade. Opening an economy to trade with other countries affects consumer surplus, producer surplus, and total economic surplus.</p> <p>2.9 POL-1.B.2 Tariffs, which governments sometimes use to influence international trade, affect domestic price, quantity, government revenue, and consumer surplus and total economic surplus.</p> <p>2.9 POL-1.B.3 Quotas can be used to alter quantities produced and therefore affect price, consumer surplus, and total economic surplus.</p>
Unit 3	3.1 a. DEFINE <u>(using graphs where appropriate) key</u>	<p>3.1 PRD-1.A.1 The production function explains the relationship between</p>

<p>Production, Cost, and the Perfect Competition Model</p>	<p><u>terms and concepts relating to production and cost.</u></p> <p>3.1 b.EXPLAIN <u>(using graphs where appropriate) how production and cost are related in the short run and long run.</u></p> <p>3.1 c. EXPLAIN <u>(using graphs or data where appropriate) firms' short-run decisions to produce positive output levels, or long-run decisions to enter or exit a market in response to profit-making opportunities.</u></p> <p>3.7 a. DEFINE <u>(using graphs as appropriate) the characteristics of perfectly competitive markets and efficiency.</u></p> <p>3.7 b. EXPLAIN <u>(using graphs where appropriate) equilibrium and firm decision making in perfectly competitive markets and how prices in perfectly competitive markets lead to efficient outcomes.</u></p> <p>3.7 c. CALCULATE <u>(using data from a graph or table as appropriate) economic profit (loss) in perfectly competitive markets</u></p>	<p>concentration of firms in a market and the market structure.</p> <p>3.4 CBA-2.C.1 Firms respond to economic profit (loss) rather than accounting profit.</p> <p>3.4 CBA-2.C.2 Accounting profit fails to account for implicit costs (such as cost of financial capital, compensation for risk, or an entrepreneur's time), which, if fully compensated, result in normal profit.</p> <p>3.5 CBA-2.D.1 Firms are assumed to produce output to maximize their profits by comparing marginal revenue and marginal cost.</p> <p>3.6 PRD-2.A.1 In the short run, firms decide to operate (i.e., produce positive output) or shut down (i.e., produce zero output) by comparing total revenue to total variable cost or price to average variable cost (AVC).</p> <p>3.6 PRD-2.A.2 In the absence of barriers to entry or exit, in the long run (i.e., once factors that are fixed in the short run become variable), firms enter a market in which there are profit-making opportunities and exit a market when they anticipate economic losses.</p> <p>3.7 PRD-3.A.1 A perfectly competitive market is efficient. Firms in perfectly competitive markets face no barriers to entry and have no market power.</p> <p>3.7 PRD-3.A.2 In perfectly competitive markets, prices communicate to consumers and producers the magnitude of others' marginal costs of production and marginal benefits of consumption and provide incentives to act on that information (i.e., price equals marginal cost in an efficient market).</p> <p>3.7 PRD-3.A.3</p>
--	---	---

		<p>In perfectly competitive markets, firms can sell all their outputs at a constant price determined by the market.</p> <p>3.7 PRD-3.A.4</p> <p>At a competitive market equilibrium, firms are price takers and select output to maximize profit by producing the level of output where the marginal cost equals marginal revenue (at the price).</p> <p>3.7 PRD-3.A.5</p> <p>At a competitive market equilibrium, the price of a product equals both the private marginal benefit received by the last unit consumed and the private marginal cost incurred to produce the last unit, thus achieving allocative efficiency.</p> <p>3.7 PRD-3.A.6</p> <p>In a short-run competitive equilibrium, price can either be above or below its long-run competitive level resulting in profits or losses, motivating entry or exit of firms and moving prices and quantities toward long-run equilibrium.</p> <p>3.7 PRD-3.A.7</p> <p>In a long-run perfectly competitive equilibrium, productive efficiency implies all operating firms produce at efficient scale, price equals marginal cost and minimum average total cost, and firms earn zero economic profit.</p> <p>3.7 PRD-3.A.8</p> <p>Firms may be in a constant cost, increasing cost, or decreasing cost industry. Long-run prices depend on the portion of the long-run cost curves on which firms operate.</p> <p>3.7 PRD-3.A.9</p> <p>A perfectly competitive market in long-run equilibrium is allocatively and productively efficient.</p>
<p>Unit 4</p> <p>Imperfect Competition</p>	<p>4.1a. DEFINE</p> <p><u>(using graphs where appropriate)</u></p> <p><u>the characteristics of imperfectly competitive</u></p>	<p>4.1 PRD-3.B.1</p> <p>Imperfectly competitive markets include monopoly, oligopoly, and monopolistic competition in product markets</p>

markets and inefficiency

4.2b EXPLAIN

(using graphs where appropriate) equilibrium, firm decision making, consumer surplus, producer surplus, profit (loss), and deadweight loss in imperfectly competitive markets and why prices in imperfectly competitive markets cannot be relied on to coordinate the actions of all possible market participants and can lead to inefficient outputs.

4.2c. CALCULATE

(using data from a graph or table as appropriate) areas of consumer surplus, producer surplus, profit (loss), and deadweight loss in imperfectly competitive markets.

4.3b. EXPLAIN

(using graphs where appropriate) equilibrium, firm decision making, consumer surplus, producer surplus, profit (loss), and deadweight loss in imperfectly competitive markets and why prices in imperfectly competitive markets cannot be relied on to coordinate the actions of all possible market participants and can lead to inefficient outputs.

4.3c. CALCULATE

(using data from a graph or table as appropriate) areas of consumer surplus, producer surplus, profit (loss), and deadweight loss in imperfectly competitive markets.

4.4b. EXPLAIN

(using graphs where appropriate) equilibrium, firm decision making, consumer surplus, producer surplus, profit (loss), and deadweight loss in imperfectly competitive markets and why prices in imperfectly competitive markets cannot be relied on

and monopsony in factor markets.

4.1 PRD-3.B.2

In imperfectly competitive output markets and assuming all else is constant, a firm must lower price to sell additional units.

4.1 PRD-3.B.3

In imperfectly competitive markets, consumers and producers respond to prices that are above the marginal costs of production and/or marginal benefits of consumption (i.e., price is greater than marginal cost in an inefficient market).

4.1 PRD-3.B.4

Incentives to enter an industry may be mitigated by barriers to entry. Barriers to entry—such as high fixed/start-up costs, legal barriers to entry, and exclusive ownership of key resources—can sustain imperfectly competitive market structures.

4.2 PRD-3.B.5

A monopoly exists because of barriers to entry.

4.2 PRD-3.B.6

In a monopoly, equilibrium (profit-maximizing) quantity is determined by equating marginal revenue (MR) to marginal cost (MC). The price charged is greater than the marginal cost.

4.2 PRD-3.B.7

In a natural monopoly, long-run economies of scale for a single firm exist throughout the entire effective demand of its product.

4.3 PRD-3.B.8

A firm with market power can engage in price discrimination to increase its profits or capture additional consumer surplus under certain conditions.

4.3 PRD-3.B.9

With perfect price discrimination, a monopolist produces the quantity where price equals marginal cost

to coordinate the actions of all possible market participants and can lead to inefficient outputs.

4.4c. CALCULATE

(using data from a graph or table as appropriate) areas of consumer surplus, producer surplus, profit (loss), and deadweight loss in imperfectly competitive markets.

4.5a. DEFINE

(using tables as appropriate) key terms, strategies, and concepts relating to oligopolies and simple games.

4.5b. EXPLAIN

(using tables as appropriate) strategies and equilibria in simple games and the connections to theoretical behaviors in various oligopoly market and non-market settings.

4.5 c. CALCULATE

(using tables as appropriate) the incentive sufficient to alter a player's dominant strategy.

(just as a competitive market would) but extracts all economic surplus associated with its product and eliminates all deadweight loss.

4.4 PRD-3.B.10

In a market with monopolistic competition, firms producing differentiated products may earn positive, negative, or zero economic profit in the short run. Firms typically use advertising as a means of differentiating their product. Free entry and exit drive profits to zero in the long run. The output level, however, is smaller than the output level needed to minimize average total costs, creating excess capacity. The price is greater than marginal cost, creating allocative inefficiency.

4.5 PRD-3.C.1

An oligopoly is an inefficient market structure with high barriers to entry, where there are few firms acting interdependently.

4.5 PRD-3.C.2

Firms in an oligopoly have an incentive to collude and form cartels.

4.5 PRD-3.C.3

A game is a situation in which a number of individuals take actions, and the payoff for each individual depends directly on both the individual's own choice and the choices of others.

4.5 PRD-3.C.4

A strategy is a complete plan of actions for playing a game; the normal form model of a game shows the payoffs that result from each collection of strategies (one for each player).

4.5 PRD-3.C.5

A player has a dominant strategy when the payoff to a particular action is always higher independent of the action taken by the other player.

4.5 PRD-3.C.6

A Nash equilibrium is a condition describing the set of actions in which no player can increase his or her payoff by

		<p>unilaterally taking another action, given the other players' actions.</p> <p>4.5 PRD-3.C.7 Oligopolists have difficulty achieving the monopoly outcome for reasons similar to those that prevent players from achieving a cooperative outcome in the Prisoner's Dilemma; nevertheless, prices are generally higher and quantities lower with oligopoly (or duopoly) than with perfect competition.</p>
<p>Unit 5</p> <p>Factor Markets</p>	<p>5.1 a DEFINE <u>(using graphs where appropriate) key terms and concepts relating to factor markets</u></p> <p>5.1b EXPLAIN <u>(using graphs where appropriate) the relationship between factors of production, firms, and factor prices.</u></p> <p>5.1c CALCULATE <u>(using data from a graph or table where appropriate) the marginal revenue product and marginal resources cost.</u></p> <p>5.2a EXPLAIN <u>(using graphs where appropriate) firms and factors' responses to changes in incentives and constraints</u></p>	<p>5.1 PRD-4.A.1 Factors of production (labor, capital, and land) respond to factor prices (wages, interest, and rent), and employers' (firm) decision to hire is based on the productivity of the factors, output price, and cost of the factor.</p> <p>5.1 PRD-4.A.2 The quantity of labor demanded is negatively related to wage rate, while the quantity of labor supplied is positively related to the wage rate in a given labor market, other things constant.</p> <p>5.2 PRD-4.B.1 Changes in the determinants of labor demand, such as the output price and the productivity of the worker, cause the labor demand curve to shift.</p> <p>5.2 PRD-4.B.2 Changes in the determinants of labor supply (such as immigration, education, working conditions, age distributions, availability of alternative options, preferences for leisure, and cultural expectations) cause the labor supply curve to shift.</p> <p>5.3 PRD-4.C.1 In a perfectly competitive labor market, the wage is set by the market and each firm hires the quantity of workers, where the marginal factor(resource) cost(wage) equals the marginal revenue product of labor. A typical firm may be a perfect competitor in the labor market even if it is an</p>

5.3a DEFINE

(using graphs as appropriate) the characteristics of perfectly competitive factor markets.

5.3b EXPLAIN

(using graphs where appropriate) the profit maximizing behavior of firms buying labor (with other inputs fixed) in perfectly competitive markets

5.3c CALCULATE

(using data from a graph or table where appropriate) measures representing the profit-maximizing behavior fo firms buying labor (with other inputs fixed) in perfectly competitive markets.

5.3a DEFINE

(using graphs where appropriate) the profit maximizing behavior of firms buying labor (with other inputs fixed) in perfectly competitive markets

5.3c CALCULATE

(using data from a graph or table where appropriate) measures representing the profit-maximizing behavior fo firms buying labor (with other inputs fixed) in perfectly competitive markets.

imperfect competitor in its output markets.

5.3 PRD-4.C.2

A typical firm hires labor in a perfectly competitive labor market as long as the marginal revenue product of labor is greater than the market wage.

5.3 PRD-4.C.3

To minimize costs or maximize profit, firms allocate inputs such that the last dollar spent on each input yields the same amount of marginal product

5.3 PRD-4.C.4

Marginal revenue product of a factor of production is the change in total revenue divided by the change in that factor of production, which is also equal to the marginal physical product of that factor multiplied by the marginal revenue ($MRP = MP \times MR$). Firms in a perfectly competitive output market will have marginal revenue product of labor that is equal to the value of the marginal product of labor ($VMPL = MPL \times P$) because marginal revenue for each unit of output is equal to price.

5.4 PRD-4.D.1

In a monopsonistic labor market, a typical firm hires additional labor as long as the marginal revenue product is greater than the marginal factor(resource)cost (the wage of a new unit of labor plus the wage increase given to all existing labor).

5.4 PRD-4.D.2

When a typical firm hires additional workers in a monopsonistic labor market, the marginal factor (resource) cost is greater than the supply price of labor.

	<p>5.4a DEFINE <u>(using graphs as appropriate) the characteristics of monopsonistic markets</u></p> <p>5.4b EXPLAIN <u>(using graphs where appropriate) the profit-maximizing behavior of firms buying labor (with other inputs fixed) in monopsonistic markets.</u></p> <p>5.4c CALCULATE <u>(using data from a graph or table where appropriate) measures representing the profit-maximizing behavior of firms buying labor (with other inputs fixed) in monopsonistic markets.</u></p>	
<p>Unit 6</p> <p>Market Failure and the Role of Government</p>	<p>6.1a DEFINE <u>social efficiency</u></p> <p>6.1b EXPLAIN <u>(using graphs where appropriate) why resource allocation in perfectly competitive markets is socially efficient.</u></p> <p>6.1 c EXPLAIN <u>(using graphs where appropriate) how private incentives can lead to actions by rational agents that are socially understandable (inefficient) market outcomes.</u></p>	<p>6.1 POL-2.A.1 The optimal quantity of good occurs where the marginal benefit of consuming the last unit equals the marginal cost of producing that last unit, thus maximizing total economic surplus</p> <p>6.1 POL-2.A.2 The market equilibrium quantity is equal to the socially optimal quantity only when all social benefits and costs are internalized by individuals in the market. Total economic surplus is maximized at that quantity.</p> <p>6.1 POL-2B.1 Rational agents can pursue private actions to exploit or exercise market characteristics known as market power</p> <p>6.1 POL-2.B.2 Rational agents make optimal decisions by equating private marginal benefits and private marginal costs that</p>

(using data from a graph or table as appropriate) changes in market outcomes resulting from government policies in perfectly competitive and imperfectly competitive markets.

6.4 a DEFINE

government policy interventions in imperfect markets

6.4b EXPLAIN

(using graphs where appropriate) how government policies can alter market outcomes in perfectly and imperfectly competitive markets.

6.4c CALCULATE

(using data from a graph or table as appropriate) changes in market outcomes resulting from government policies in perfectly competitive and imperfectly competitive markets.

6.5a DEFINE

measure of economic inequality in income and wealth

6.4 POL-4.A.5

Government can use price regulation to address inefficiency due to monopoly.

6.4 POL-4.A.6

A natural monopoly will require a lump-sum subsidy to produce at the allocatively efficient quantity

6.4 POL-4.A.7

Governments use antitrust policy in an attempt to make markets more competitive

6.5 POL-5.A.1

Income levels and poverty rates vary greatly both across and within groups (e.g, age, gender, race) and countries

6.5 POL-5.A.2

The Lorenz curve and Gini coefficient are used to represent the degree on inequality in distributions and to compare distributions across different countries, policies or time periods

6.5 POL-5.B.1

Each factor of production receives the value of its marginal product, which can contribute to income inequality

6.5 POL-5.B.2

Sources of income and wealth inequality include differences in tax structures (progressive and regressive tax structures), human capital, social capital, inheritance, effects of discrimination, access to financial markets, mobility, and bargaining power within economic and social units (firms, labor unions, and families)
